

187-1-102-backuplarger_1

This scanning electron micrograph shows a large, light-colored mineral specimen against a dark background. The specimen has a complex, irregular shape with several sharp edges and a surface that appears to have some internal layering or texture. Two specific points on the specimen are highlighted with blue dots and labeled with text boxes. The bottom left corner features a scale bar indicating 100 micrometers. The overall image is in grayscale, typical of SEM photography.
